

# Leurre.com: a worldwide distributed platform to study Internet threats

Deployed and Managed by  
The Eurecom Institute

(teaching and research institute located on the French Riviera)

Contact Point:  
[dacier@eurecom.fr](mailto:dacier@eurecom.fr)

# Overview

- Leurré.com: why and how
- Web interface: a few examples
- Some 'non trivial' results.
- Conclusions

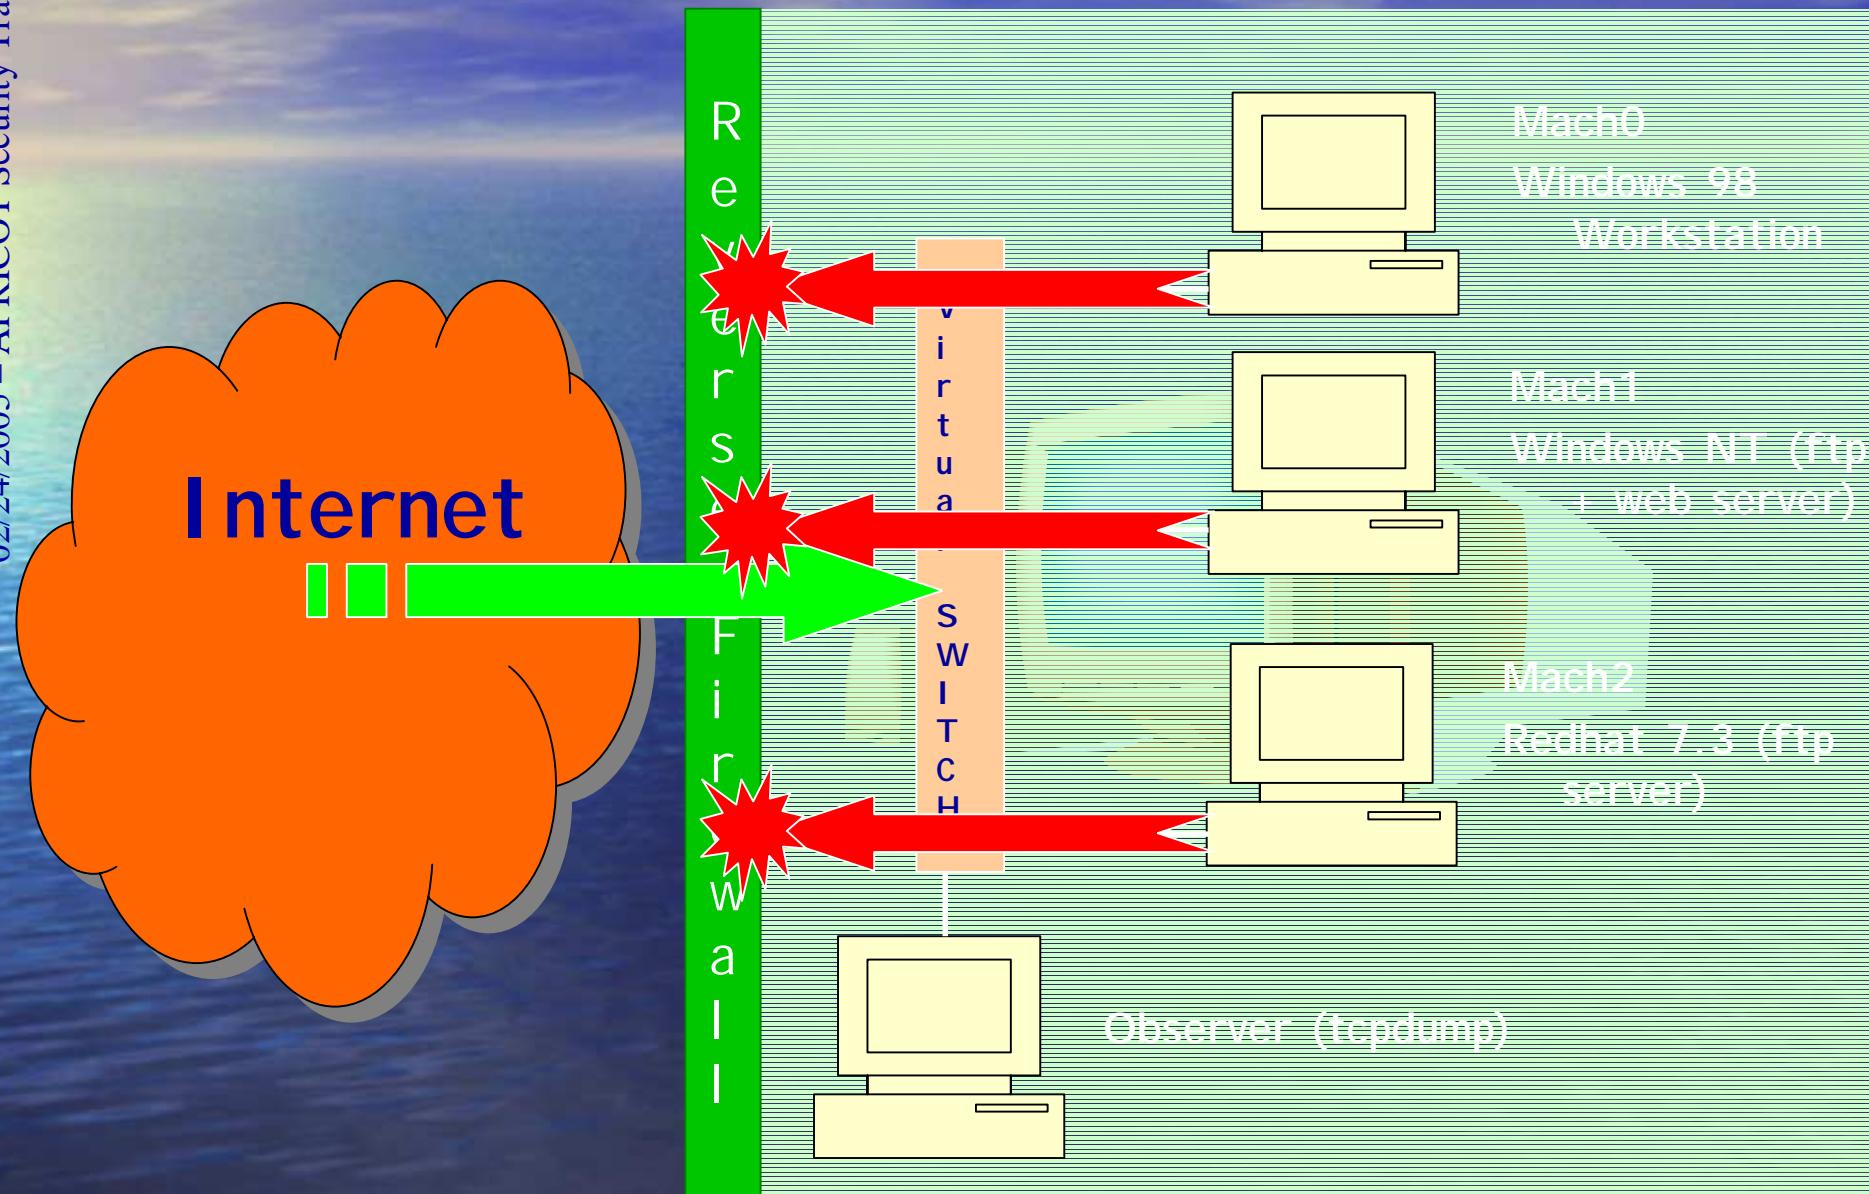

# Motivations

- We do not precisely know the threats we are facing and we do not know if/how they evolve ...
- ... because of the lack of model to characterize them ...
- ... because of the lack of unbiased, quantitative data available to build such model ...
- ... because of the lack of environment to collect such data!

# Leurre.com

- This project aims at deploying the very same honeypots in a large number of diverse locations.
- Early results demonstrate the complementarity of this approach to so-called *Internet telescopes* and Darknets.
- You can see this as a simple, widely distributed, fine grained network monitoring system

# Experimental Set Up

# 30 platforms, 20 countries, 5 continents

In Europe ...

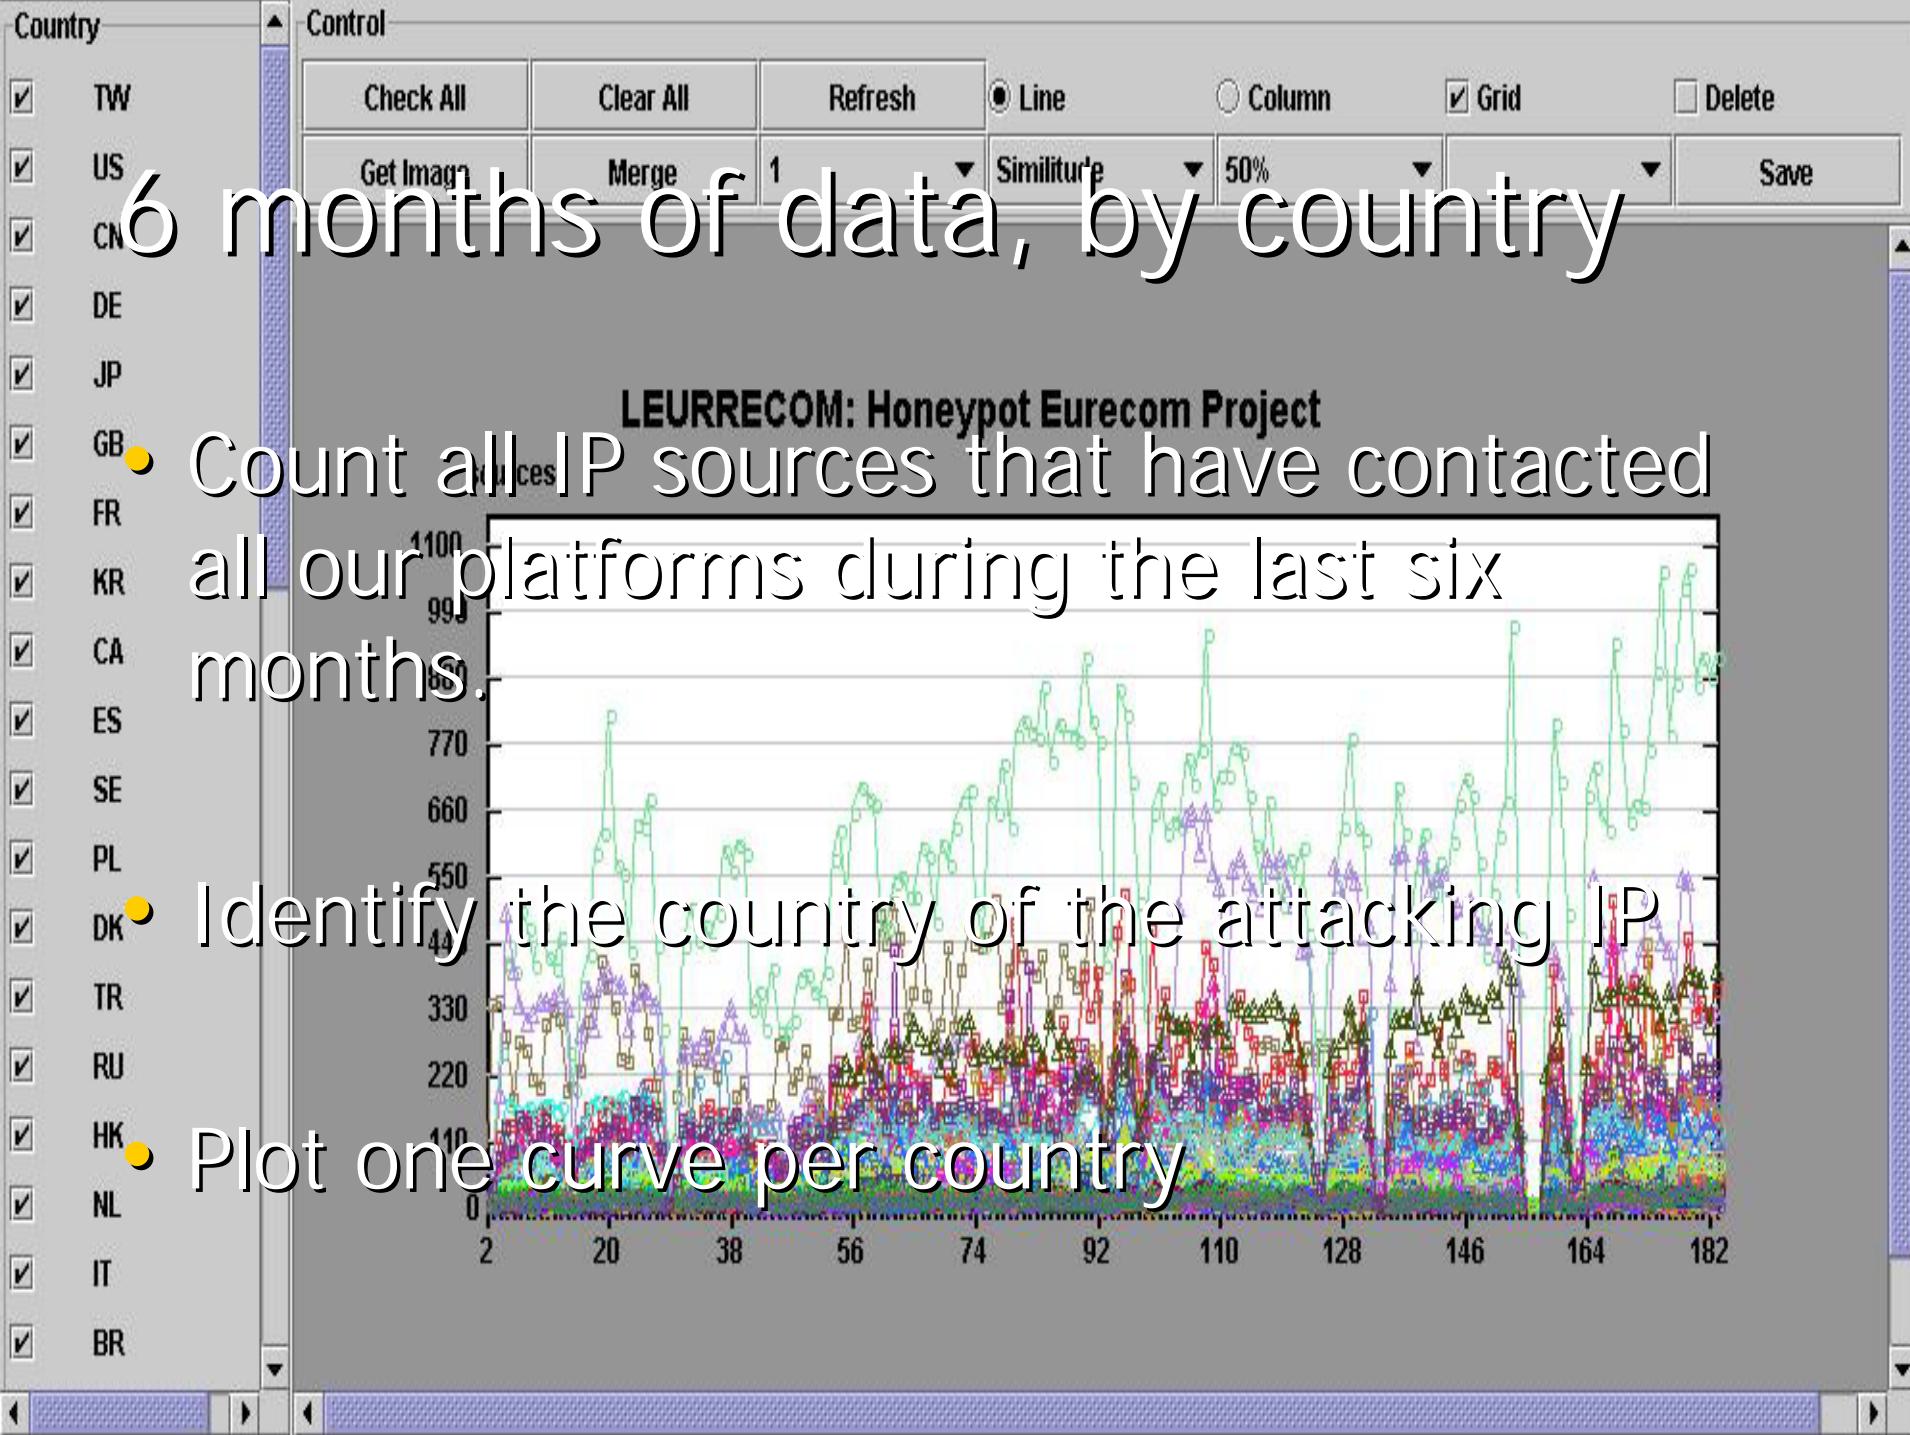

# Win-Win Partnership

- The interested partner provides ...
  - One old PC (pentiumII, 128M RAM, 233 MHz...),
  - 4 routable IP addresses,
- EURECOM offers ...
  - Installation CD Rom
  - Remote logs collection and integrity check.
  - Access to the whole SQL database by means of a secure web access.

# Overview

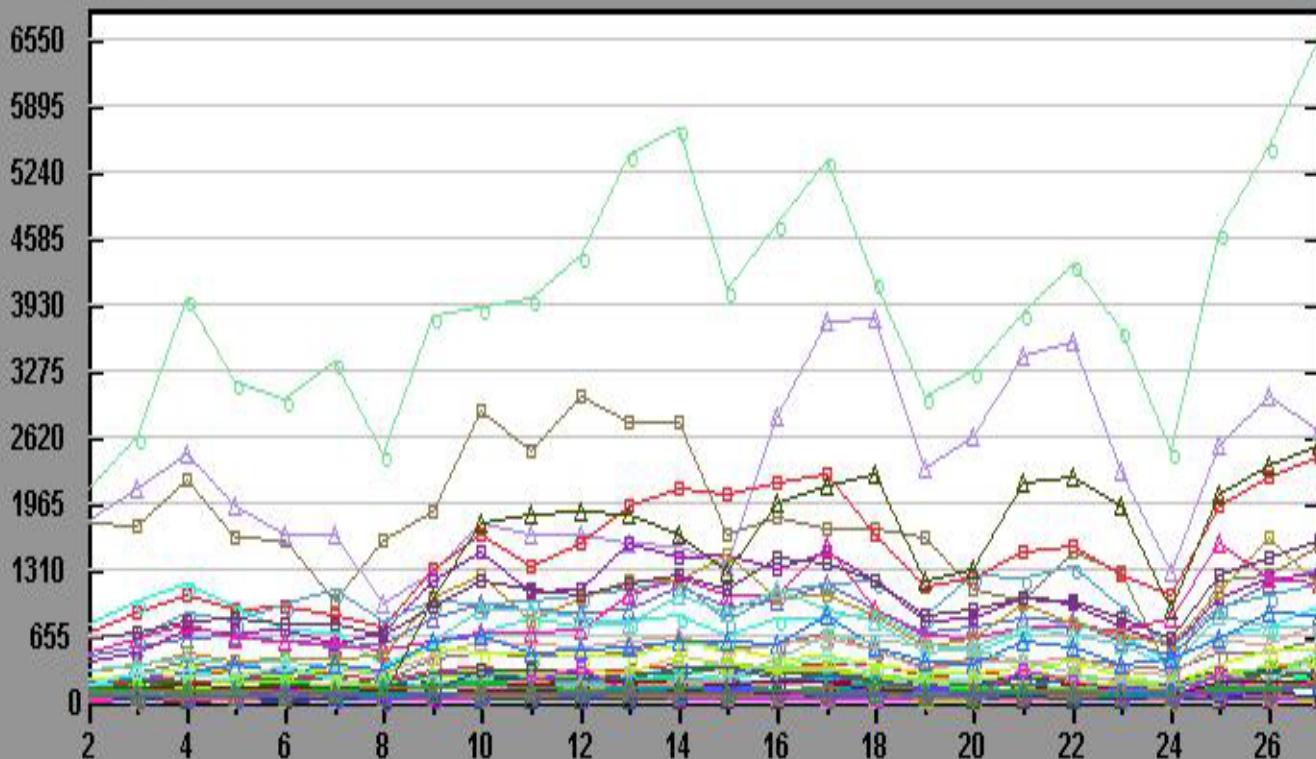

- **Leurre.com: why and how**
- Web interface: a few examples
- Some 'non trivial' results.
- Conclusions

## **RECOM: Honeypot Eurecom Project**

# YU: Serbia and Montenegro

- YU has contacted only one platform
- Identify the sequence of ports probed by each attacking IP
- Plot one curve per sequence of ports

# W32.Welchia.D.Worm ???

- Exploits multiple vulnerabilities, including:
  - The DCOM RPC vulnerability using TCP port 135.
  - The Workstation service buffer overrun vulnerability using TCP port 445.
  - The Locator service vulnerability using TCP port 445
- Targets Windows XP and Windows 2000  
(Windows NT also vulnerable to the first 2 attacks)

# One more viewpoint

- Use passive OS fingerprinting tools (p0f, disco, ettercap) against each attacking IP.
- Plot one curve for each OS type.

## LEURRECOM: Honeypot Eurecom Project

sources

# Discussion

- Welchia does not seem to be the only cause of these attacks because of:
  - The bizarre peak of attacks coming from NT boxes
  - The fact that only one platform is targeted by this country
- Are there attackers ‘surfing’ on the traces of other attacks in order to hide themselves?
- More research is required.

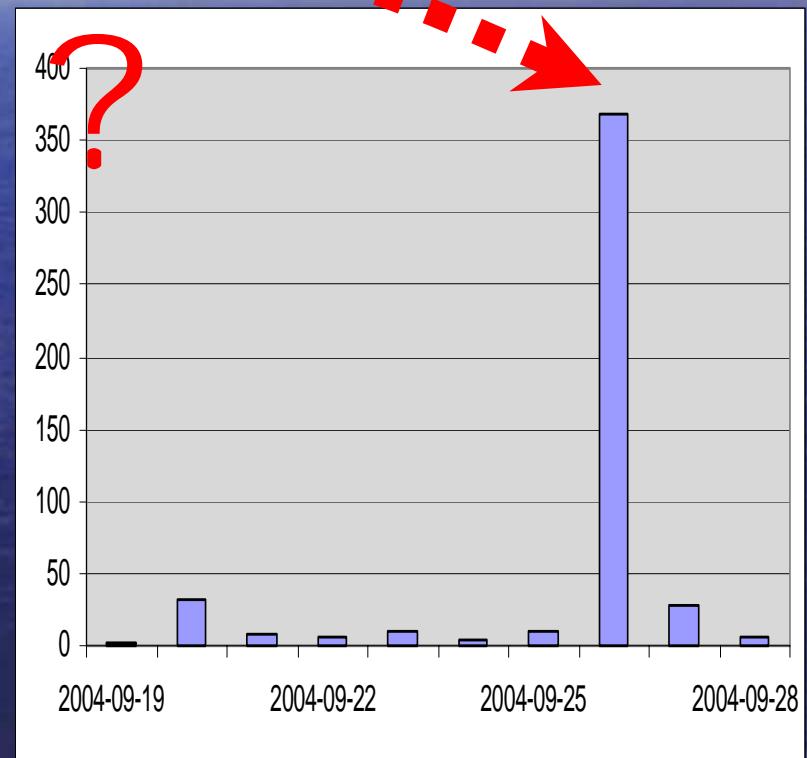

# Overview

- **Leurre.com: why and how**
- **Web interface: a few examples**
- Some 'non trivial' results.
- **Conclusions**

# ISC (Dshield) Limitations

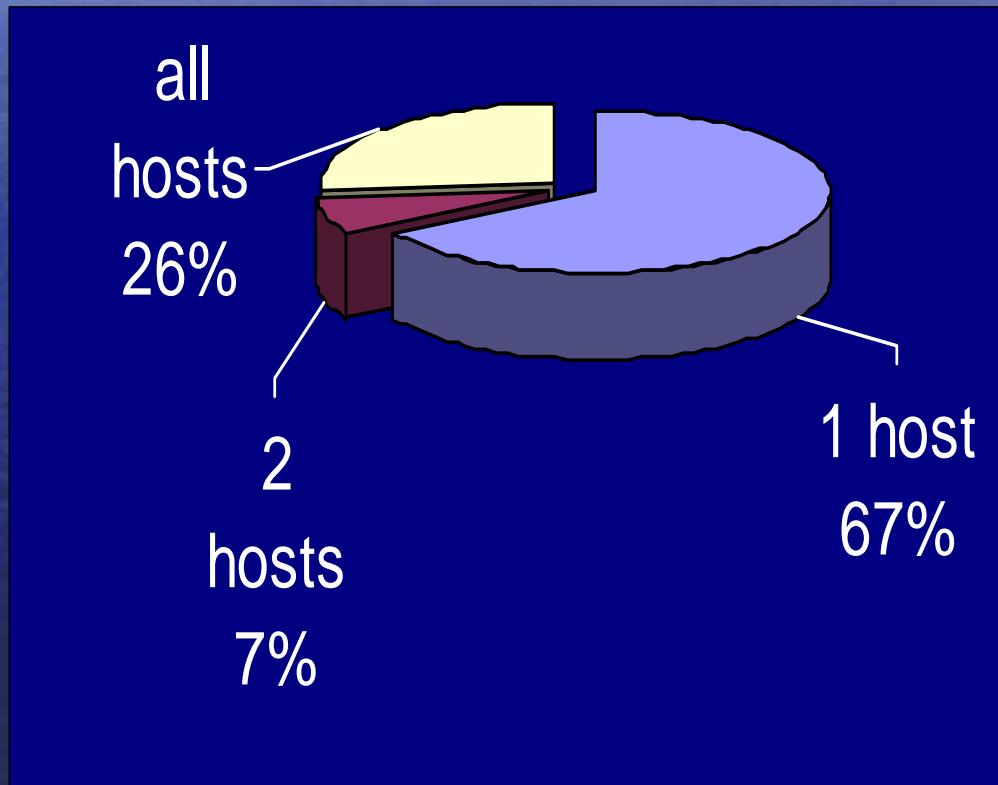

Source: Internet Storm Center

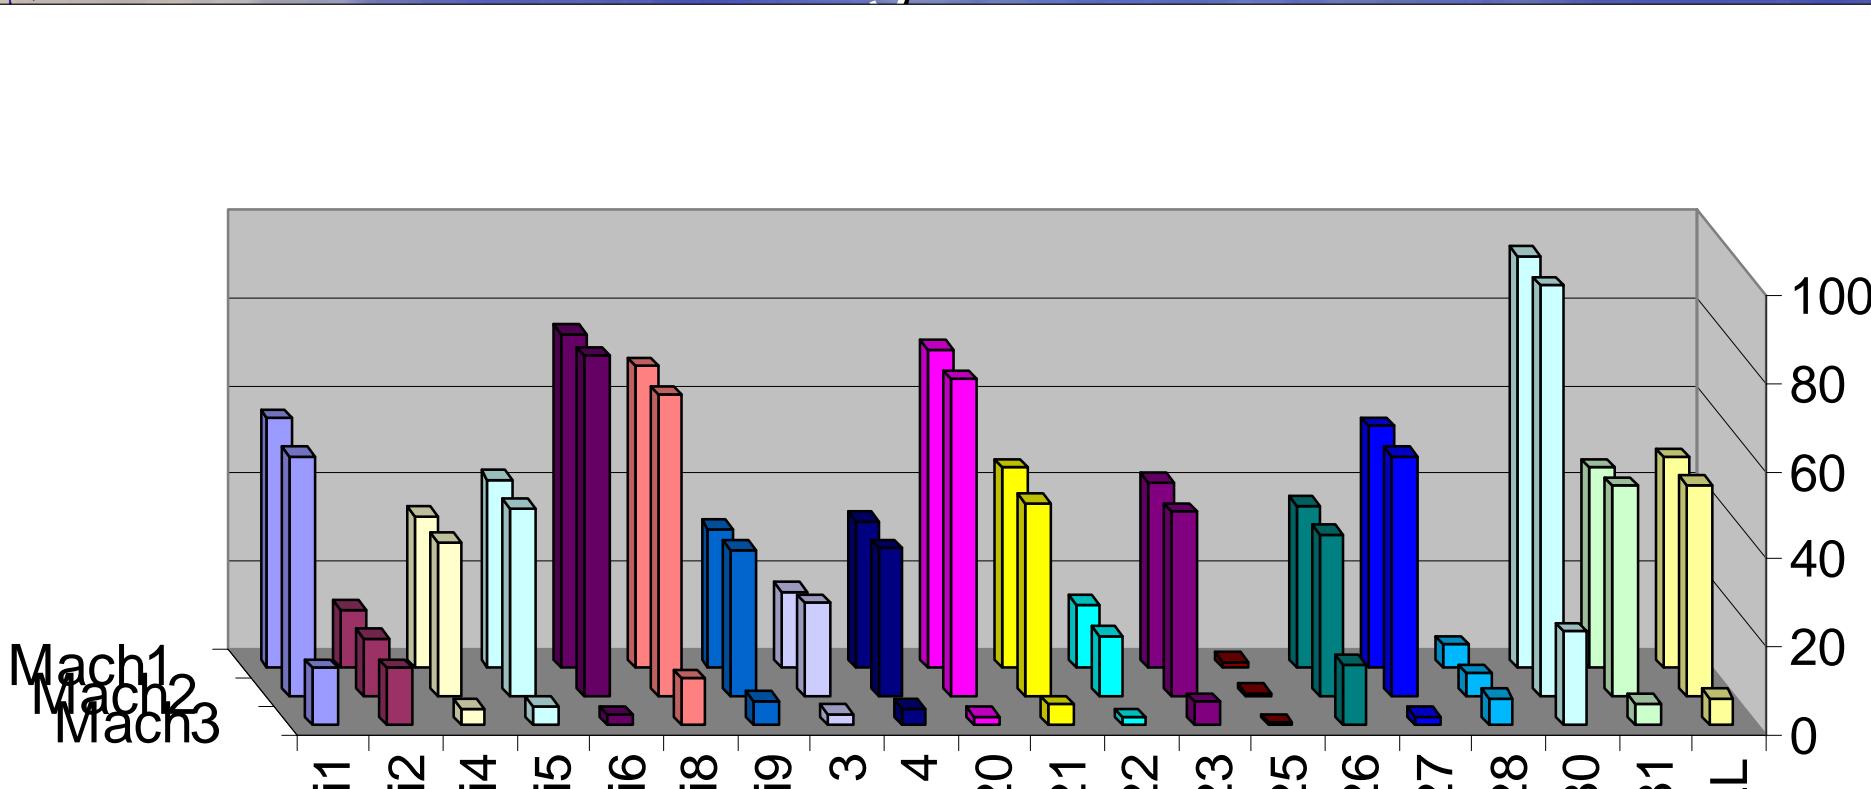

Source: Leurre.com

# During the last 6 months

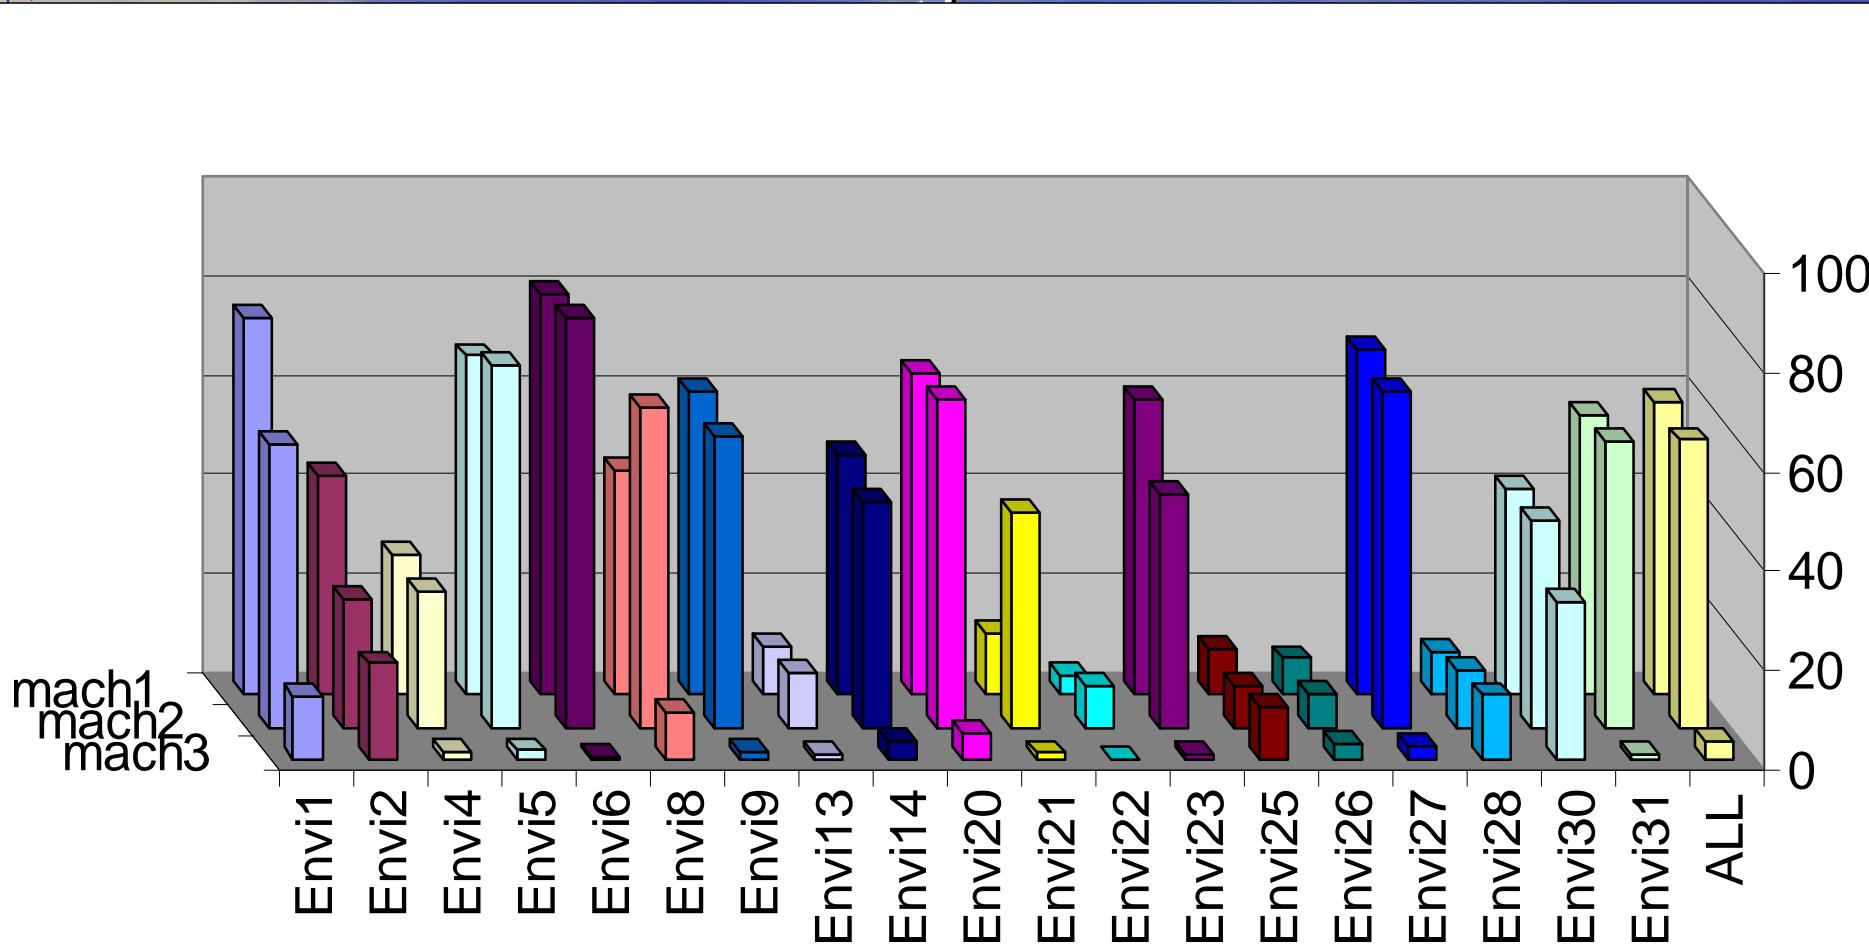

- 345718 IPs have probed only 1 host per platform
- 36287 have probed only 2 hosts per platform
- 136331 IPs have probed all hosts of a given platform

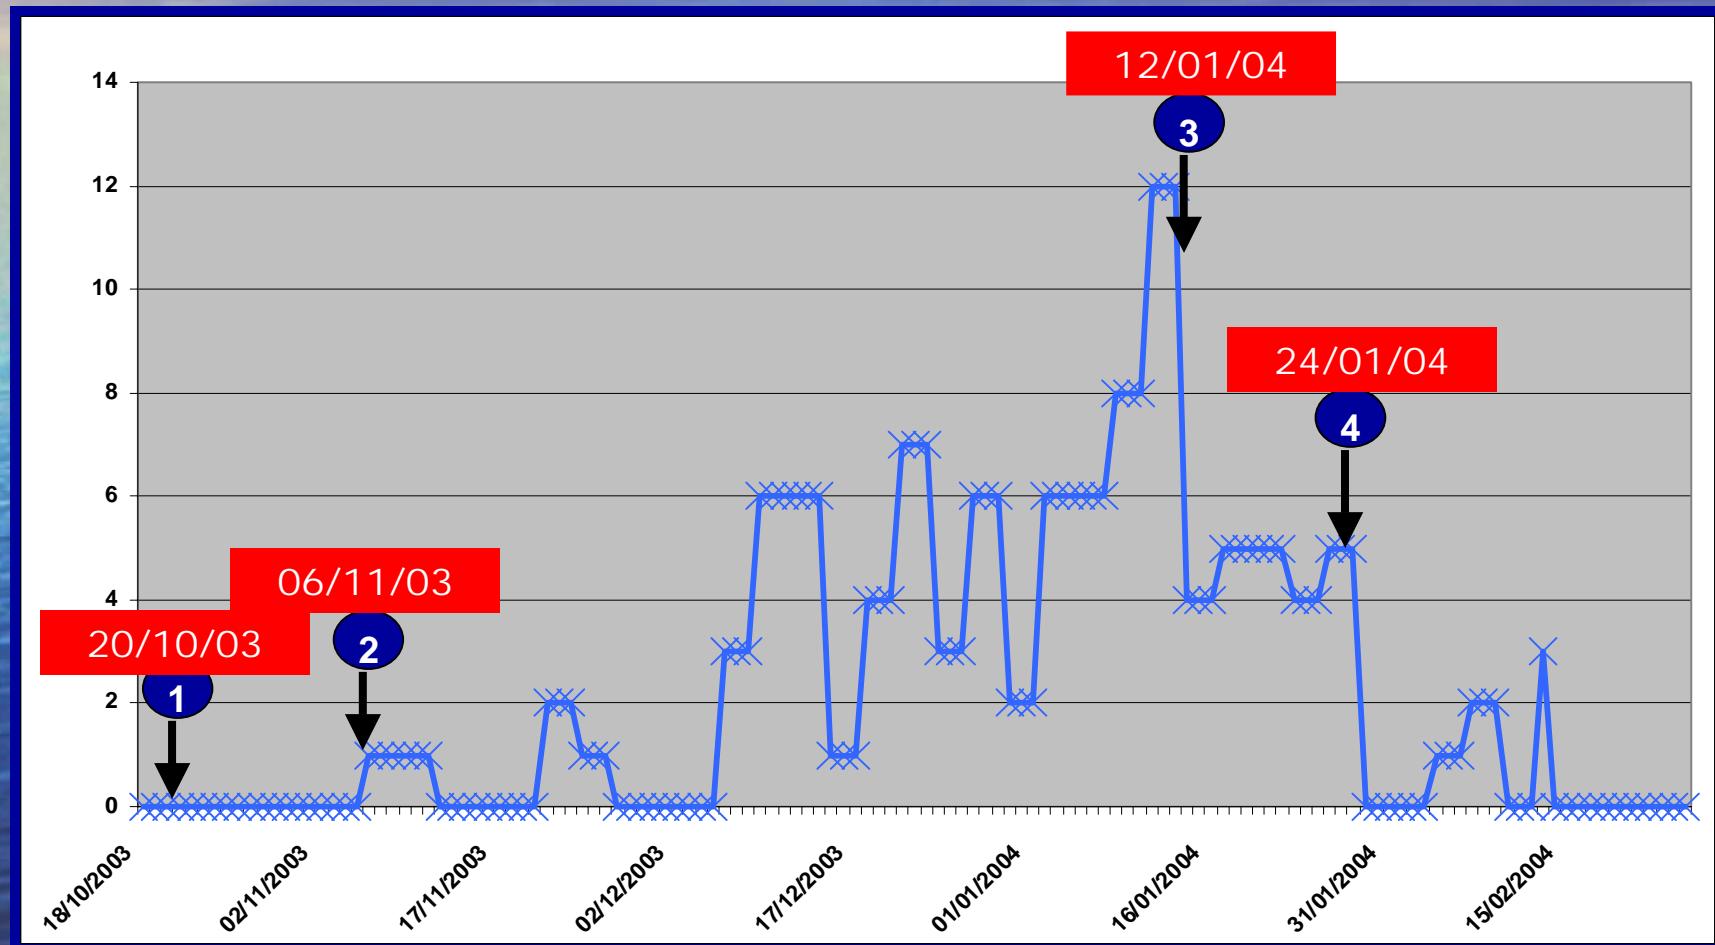

# $P(\text{sending a packet to an open port})$ for an attacker who sends packets to all machines of a given environment

P(sending a packet to an open port)  
for an attacker who sends packets to only  
one machine of a given environment

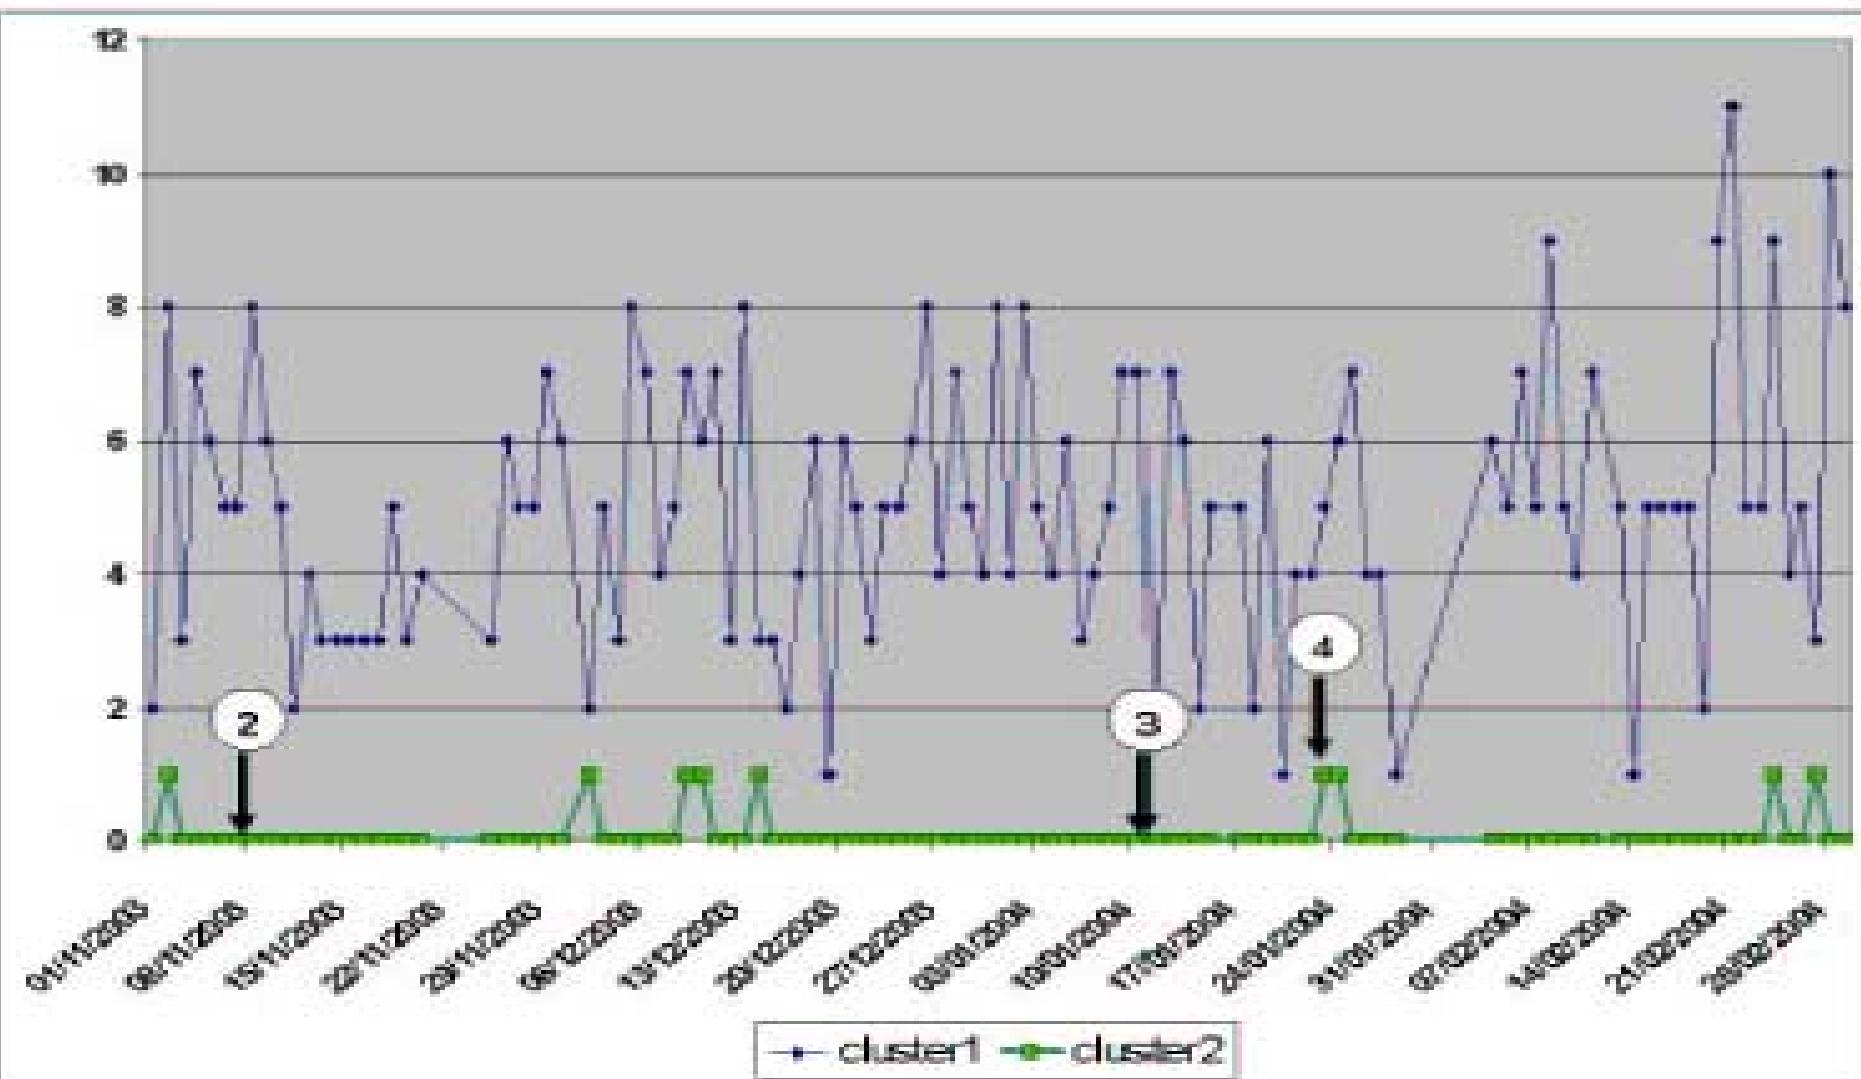

# Targeted attacks: Port 1433 example

# Results: identification of the scanner

- 5 different types of scans have probed that port between point 1 and point 2
- Only 2 of these 5 have been observed between point 3 and 4.
- The scanning tool is quite likely one of these two.

# Results: identification of the scanner (ctd.)

# Overview

- **Leurre.com: why and how**
- **Web interface: a few examples**
- Some ‘non trivial’ results.
- Conclusions

# Conclusions

- Experience shows that this data set is a gold mine for researchers.
- It can provide the foundations to build a new generation of early warning information systems
- We, at Eurecom, can only take advantage of a fraction of it.

# We need you ...

- ... to deploy more platforms in Asia Pacific.
- ... to see other teams carrying out their own research with our data sets.
- ... to build a truly international cooperative environment to fight Internet threats.
